

## Airport Project Notes

PSEUDO, PSEUDO, PSEUDO!

Make a list where if one ticket is sold, a person is added to the list, additionally tickets remaining -= 1

We need to be able to also add tickets back if people want to refund tickets

Data must be persistent, thus using databases!

Note the plane can hold 335 people but there are 35 staff, and thus only 300 tickets can be sold.

Data needs to be added to the SQL database when we add a passenger and removed from database when we lose a database.

We make this as if we are making a ten story building, we need to make sure the blueprint is good first.
